

Education

Babcock University

Jan 2021 – July 2025

Bachelor of Computer Science (Information Systems)

Illishian-Remo, Ogun State, Nigeria

- First Class Honors

Courses: Machine Learning with Python, Artificial Intelligence and Application, Operating Systems, Web Design and Development, Algorithms and Data Structure, Introduction to Software Engineering

Work Experience

May & Baker

Jan 2024 – July 2025

IT Support Intern (POST SIWES)

5 Sapara St, Oba Aren, Ikeja 101233, Lagos

- Replacing, updating system hardware components, and diagnosing system failures for all departments in the company
- Repairing Network cables and diagnosing network problems.
- Reporting and recording system diagnosis for performance management.

Projects

Chatbot-AKSBOT-AI (Best Overall Project | GDG Hackathon)

Python | Groq | DeepGram | Streamlit

- Designed and deployed a full-stack chat-bot web application.
- Designed and implemented a multi-modal chat bot for different modes of interaction for the user.

Fetal Brain Abnormality Risk Assessment with AI

Pandas | Pytorch | Scikit-Learn | Python

- Designed and implemented a full-stack web application for tracking fetal-brain abnormality risk using both ultra-scans and symptoms-based detection to help front desk workers at hospitals.
- Achieved an accuracy score of 90% on ultra-scan risk scanner, and 99% on symptom-based scanner.

Email Feedback with Natural Language Processing

Pandas | NLTK | Python

- Built a feedback system for automatically monitoring user emails for feedback, and detecting the sentiment of user feedback, positive or negative, and storing in a report.

Neural Network from scratch with Numpy (Neonet)

Python | Numpy

- Built a deep learning library called neonet, which can be used to create neural networks. I built it from scratch using only numpy
- Implemented Vectorized forward pass and back propagation, to get similar speed with Keras on small and medium sized ML tasks
- Achieved 80-90% accuracy on test benchmarks, IRIS, CANCER, WINE, MNIST dataset.
- Implemented multiple training configurations for training and different optimization methods. Also added different activation functions, and loss functions.

AI Real time Interview Multi-Modal Agent

Google-adk | Python | React | FastAPI | GCP | Typescript

- Designed the system architecture for the back-end and contributed to reducing the token cost for real-time interview by using token compression and caching while significantly improving performance by reducing the request overhead and maintaining transcription quality.
- Contributed to the front-end, by designing the meeting-interface between the user and AI agent, optimizing client-side audio sampling and frame capture pipelines to improve signal quality and reduce processing overhead on the back-end.
- Deployed and configured the backend on Google Cloud Platform, provisioning scalable compute and managing service dependencies to support concurrent real-time agent sessions.

Technical Skills

Languages: Python, JavaScript

Developer Tools: Git, Docker, Postman, GCP

Libraries/Frameworks: ReactJS, NextJS, NodeJS, Tensorflow, Pytorch, FastAPI, MongoDB
